# Livescore Bluem IDIN

Workflow 1 (IDINStart):

1. Live score calls the first sphonic workflow, providing the unique user ID and the URL they want the user sent too after the IDIN check has been completed.
2. Sphonic will then call out to Bluem who return the identURL that livescore need to direct the user to for them to give consent for the check and also the bluemtransactionID.
3. The 1st workflow now ends. Once the user has given consent, the user is sent to the URL which is provided in the request whilst the second workflow runs i.e a holding page.

Workflow2 (IDINRetrieve) :

1. Whilst the user in the holding page, Livescore calls out to the second sphonic workflow providing the bluemtransactionID and the Unique request id from the first workflow.
2. Sphonic then calls out to Bluem to retrieve applicant data and then returns the response back to livescore.
3. If the check is successful the response will show that the outcome is "success" and will return the applicants name, address, dob, gender and contact details.
4. If the check is not successful it will return in the response an outcome of either: "Expired", "Cancelled", "Open", "Pending", "Failure", "Error(SE27000)"
5. The second workflow now ends.
